

Two-Dimensional Arrays

Ordering of Rows and Columns

- ▶ Row-Major Order

When row-major order (most common) is used, the first row appears at the beginning of the memory block. The last element in the first row is followed in memory by the first element of the second row.

- ▶ Column-Major Order

When column-major order is used, the elements in the first column appear at the beginning of the memory block. The last element in the first column is followed in memory by the first element of the second column.

Row-Major and Column-Major Ordering

Logical arrangement:

| | | | | |
|----|----|----|----|----|
| 10 | 20 | 30 | 40 | 50 |
| 60 | 70 | 80 | 90 | A0 |
| B0 | C0 | D0 | E0 | F0 |

Row-major order

| | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | A0 | B0 | C0 | D0 | E0 | F0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Column-major order

| | | | | | | | | | | | | | | |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 10 | 60 | B0 | 20 | 70 | C0 | 30 | 80 | D0 | 40 | 90 | E0 | 50 | A0 | F0 |
|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|

Operand Types

- ▶ Base-Index Operands
- ▶ Base-Index-Displacement Operands

Base-Index Operands

- ▶ A base-index operand adds the values of two registers(called base and index), producing an offset address:
[base + index]

```
.data
array WORD 1000h,2000h,3000h
.code
mov     ebx,OFFSET array
mov     esi,2
mov     ax,[ebx+esi]           ; AX = 2000h

mov     edi,OFFSET array
mov     ecx,4
mov     ax,[edi+ecx]          ; AX = 3000h

mov     ebp,OFFSET array
mov     esi,0
mov     ax,[ebp+esi]          ; AX = 1000h
```

Base-Index Operands

- ▶ When accessing a two-dimensional array in row-major order, the row offset is held in the base register and the column offset is in the index register.

```
tableB  BYTE    10h,  20h,  30h,  40h,  50h
Rowsize = ($ - tableB)
        BYTE    60h,  70h,  80h,  90h,  0A0h
        BYTE    0B0h, 0C0h, 0D0h, 0E0h, 0F0h
```

Base-Index Operands

- ▶ Suppose we want to locate a particular entry in the table using row and column coordinates.
- ▶ Assuming that the coordinates are zero based, the entry at row 1, column 2 contains 80h.
- ▶ We set EBX to the table's offset, add ($\text{Rowsize} * \text{row index}$) to calculate the row offset, and set ESI to the column index.

Base-Index Operands

- Suppose the array is located at offset 0150h.

row_index = 1
column_index = 2
Rowsize = 5

| | 0 | 1 | 2 | 3 | 4 |
|---|----|----|----|----|----|
| 0 | 10 | 20 | 30 | 40 | 50 |
| 1 | 60 | 70 | 80 | 90 | A0 |
| 2 | B0 | C0 | D0 | E0 | F0 |

| 150 | 151 | 152 | 153 | 154 | 155 | 156 | 157 | 158 | 159 | 15A | 15B | 15C | 15D | 15E |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | A0 | B0 | C0 | D0 | E0 | F0 |

Base-Index Operands

`mov ebx,OFFSET tableB` ; table offset

| | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 150 | 151 | 152 | 153 | 154 | 155 | 156 | 157 | 158 | 159 | 15A | 15B | 15C | 15D | 15E |
| 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | A0 | B0 | C0 | D0 | E0 | F0 |

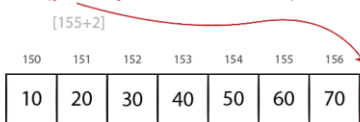

$5 * 1$
`add ebx,RowSize * row_index` ; row offset

| | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 150 | 151 | 152 | 153 | 154 | 155 | 156 | 157 | 158 | 159 | 15A | 15B | 15C | 15D | 15E |
| 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | A0 | B0 | C0 | D0 | E0 | F0 |

`mov esi,column_index`
`mov al,[ebx + esi]` ; AL = 80h

[155+2]

| | | | | | | | | | | | | | | |
|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| 150 | 151 | 152 | 153 | 154 | 155 | 156 | 157 | 158 | 159 | 15A | 15B | 15C | 15D | 15E |
| 10 | 20 | 30 | 40 | 50 | 60 | 70 | 80 | 90 | A0 | B0 | C0 | D0 | E0 | F0 |

Scale Factors

If you're writing code for an array of WORD, multiply the index operand by a scale factor of 2.

```
tableW WORD 10h, 20h, 30h, 40h, 50h
RowSizeW = ($ - tableW)
        WORD 60h, 70h, 80h, 90h, 0A0h
        WORD 0B0h, 0C0h, 0D0h, 0E0h, 0F0h

.code
row_index = 1
column_index = 2
mov     ebx,OFFSET tableW                ; table offset
add     ebx,RowSizeW * row_index          ; row offset
mov     esi,column_index
mov     ax,[ebx + esi*TYPE tableW]        ; AX = 0080h
```

Scale Factors

Similarly, you must use a scale factor of 4 if the array contains doublewords:

```
tableD DWORD 10h, 20h, ...etc.  
.code  
mov    eax, [ebx + esi*TYPE tableD]
```

Base-Index-Displacement Operands

- ▶ A base-index-displacement operand combines a displacement, a base register, an index register, and an optional scale factor to produce an effective address. Here are the formats:
[base + index + displacement] displacement[base + index]
- ▶ Displacement can be the name of a variable.
- ▶ Base-index-displacement operands are well suited to processing two-dimensional arrays.
- ▶ The displacement can be an array name, the base operand can hold the row offset, and the index operand can hold the column offset.

Base-Index-Displacement Operands

```
tableD DWORD    10h,   20h,   30h,   40h,   50h
Rowsize = ($ - tableD)
        DWORD    60h,   70h,   80h,   90h,   0A0h
        DWORD    0B0h,  0C0h,  0D0h,  0E0h,  0F0h
```

- ▶
- ▶ Assuming that the coordinates are zero based, the entry at row 1, column 2 contains 80h. To access this entry, we set EBX to the row index and ESI to the column index:

```
mov     ebx,Rowsize           ; row index
mov     esi,2                 ; column index
mov     eax,tableD[ebx + esi*TYPE tableD]
```

Base-Index-Displacement Operands

- ▶ How to get this value?

```
tableD DWORD    10h,  20h,  30h,  40h,  50h
Rowsize = ($ - tableD)
        DWORD    60h,  70h,  80h,  90h,  0A0h
        DWORD    0B0h, 0C0h, 0D0h, 0E0h, 0F0h
```

Base-Index-Displacement Operands

- How to get this value?

```
tableD DWORD    10h, 20h, 30h, 40h, 50h
Rowsize = ($ - tableD)
        DWORD    60h, 70h, 80h, 90h, 0A0h
        DWORD    0B0h, 0C0h, 0D0h, 0E0h, 0F0h
```

mov ebx,Rowsize * 2

mov esi,3

mov eax,tableD[ebx + esi*TYPE tableD]

; row index

; column index
